LIFTERS FOR VEHICLE TRANSPORT TRUCKS

We design and manufacture various types of lifters and platforms for the loading of vehicles. The platform lifter shown in the photograph is installed on the lower level of the truck, behind the bogie unit. By means of the lifter, the front axle of the truck carried can be lowered, which enables the carriage of even high cabins. When using 1.5 metre drive bridges as an extension to the platform lifter, loading can take place directly from the ground.
